

# Remote sensing reflectance from SOOP in the Skagerrak and Norwegian coastal waters

Kai Sørensen  
**Are Folkestad**  
Pierre Jaccard

# Outline

- Radiometric sensor systems
- Data handling, processing and quality control
- SOOP vs R/V observations
- Validation of satellite ocean colour data

# Radiometric parameters

- $E_d$ , Downwelling irradiance (180° FOV)
- $L_d$ , Downwelling radiance (7° FOV)
- $L_u$ , Upwelling radiance (7° FOV)

Wavelength range: 350-900nm

Band interval: 3-4nm

Primary focus on satellite validation

- Calculate  $\rho_w$ , Remote sensing (Water-leaving) reflectance
- Validation of Envisat/MERIS reflectance

# Calculating MERIS reflectance from RAMSES measurements of $L_u$ , $L_d$ , and $E_d$

MERIS reflectance  $\rho_w'(\vartheta, \varphi, \lambda) = \pi \frac{L_u(\vartheta, \varphi, \lambda)}{E_d(\lambda)}$  (Eq. 1)

RAMSES  $L_u$  sensor measures:

$L_u + L_u^{refl}$

Reflected from surface

From beneath surface (to be used in Eq. 1)

RAMSES  $L_d$  sensor Used to find  $L_u^{refl}$

$$L_u^{refl}(\vartheta, \varphi, \lambda) = r_L L_d(\pi - \vartheta, \varphi, \lambda)$$

We calculate the reflectance as:

$$\rho_w = \pi (L_u - r_L L_d) / E_d$$

where  $r_L = 2\%$  for flat surface and  $2.8\%$  for rough surface.

# Sensor setup on SOOP vs Research Vessel

# Sensor configuration

Two sets of TriOS RAMSES sensors (Lu, Ld, Ed)

- Port
- Starboard

Radiance sensor angles

- Avoid sun glint
- Avoid shadow from ship
- Avoid reflection from ship
- Minimum surface reflection of sky radiance

# Ships and routes with radiometric sensors

- M/S Trollfjord (Bergen-Kirkenes) 2004→
- M/S Color Festival (Oslo-Denmark) 2005-2008
- M/S Color Fantasy (Oslo-Kiel) 2008→

# Data collection/handling

- System status check and operation of the sensors are done remotely (or onboard).
- Data stored in MSDA database onboard
- Large amount of data collected every day (100-200MB)
- Data transferred from ship by USB stick
- Internet bandwidth limits automatic data transfer to NIVA server
- Presently no requirements for near real-time processing, but we are working towards a fully automated system for data transfer to NIVA server and subsequent processing and quality control.

# Data Processing

- Extraction from MSDA database
- Split by days
- Bug corrections *time, position, ...*
- Sensors synchronizations ( $t, \lambda$ )
- Merge sensor data for each ship side
- Merge GPS positions from Ferrybox, if necessary
- Add sun and view angles (zenith and azimuth)
- Elementary flagging

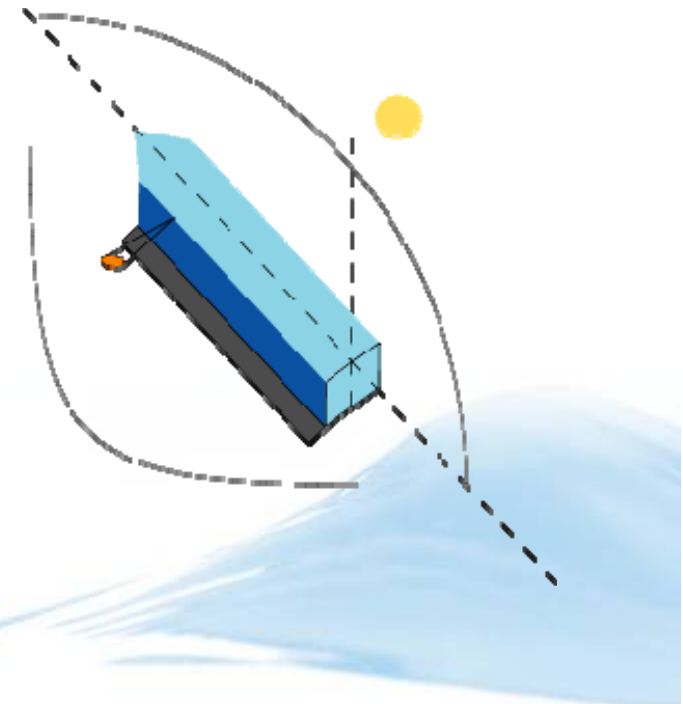

# Data File Format

Data	year	month	day	time	lat	lon	Spd	Crs	SZA	SAA	VZA	VAA	VS
Format	I4	I2	I2	F7.4	F6.3	F7.3	F4.1	F5.1	F5.2	F5.1	F5.2	F5.1	F4.1
Unit	none	none	none	UT decimal	Deg.	Deg.	m/s	Deg.	Deg.	Deg.	Deg.	Deg.	m/s.
	2007	3	21	8.936	57.632	10.719	10.1	189.0	64.55	138.1	15.00	139.0	194

N	L_up	L_down	E_down
I2	E9.3	E9.3	E9.3
<i>non</i>	<i>W/m<sup>2</sup>/μm/sr</i>	<i>W/m<sup>2</sup>/μm/sr</i>	<i>W/m<sup>2</sup>/μm</i>
255	1.167E+00	4.217E+01	7.939E+01

# Flagging

- Speed > 5 knots
- Sun Zenith Angle < 75
- Shadow from ship (sensor angle relative to sun)
- Glint (sky and water)
- Atmosphere Optical Thickness
  - AOT > 2
  - AOT > 0.8

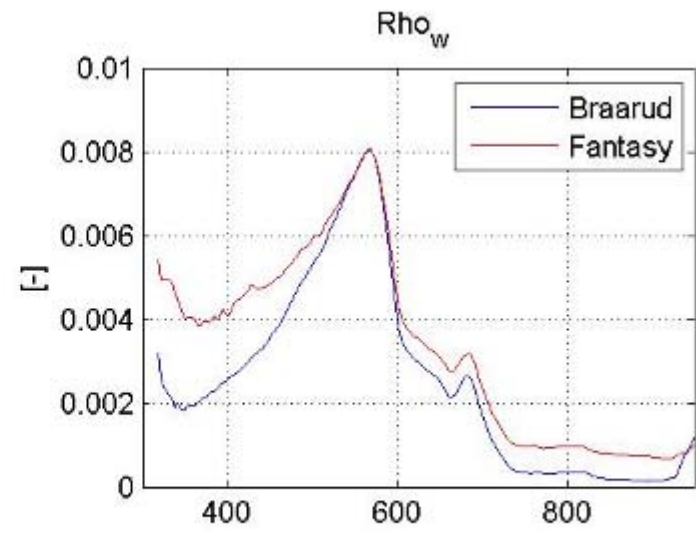

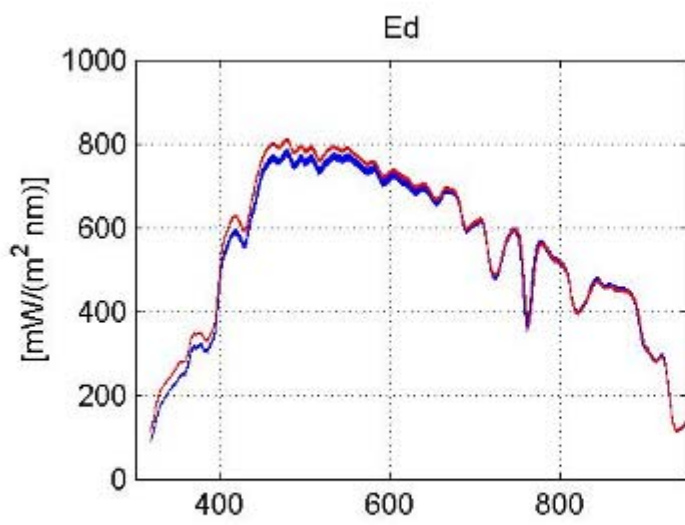

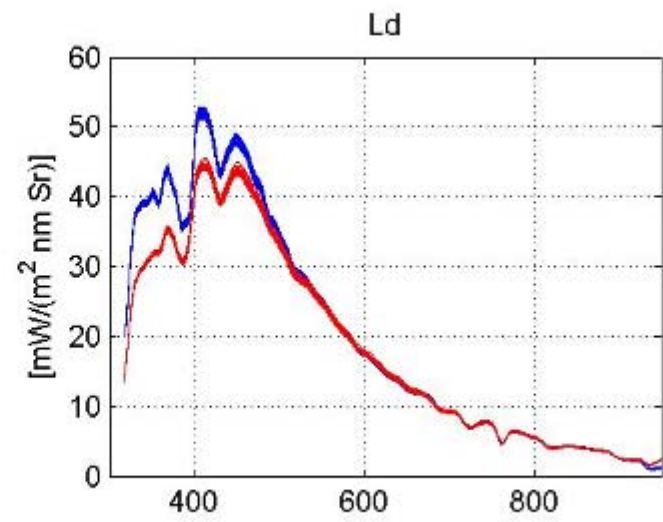

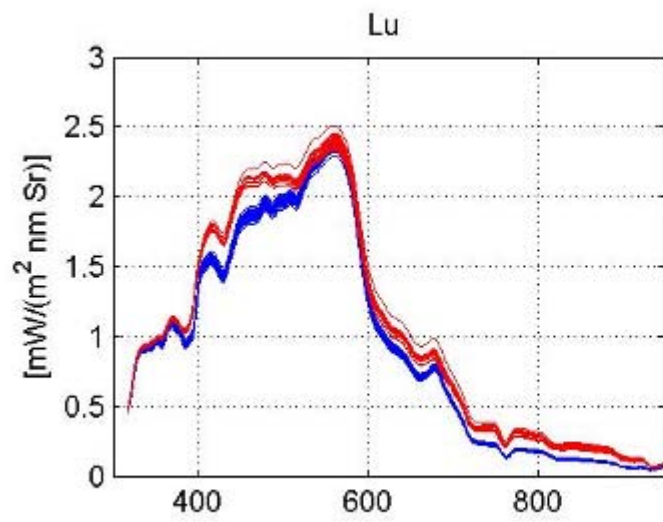

# SOOP and R/V data inter-comparison

Inner Oslofjord 25 June & 26 August 2009

Identical sensor viewing angles

## In situ measurements with varying radiance sensor nadir angle

Investigate influence on

- Diffuse attenuation coefficient
- Water-leaving reflectance

Extrapolate information to

- Evaluate influence of varying sensor angles on SOOP data
- Optimize future selection of sensor viewing angles

0-45°

## Another SOOP (Trollfjord) and R/V Inter-comparison exercise planned in April 2010

# MERIS validation in the Skagerrak

# Large amount of in situ data available as potential satellite matchups

2005: 74 days  
 2006: 160 days  
 2007: 174 days

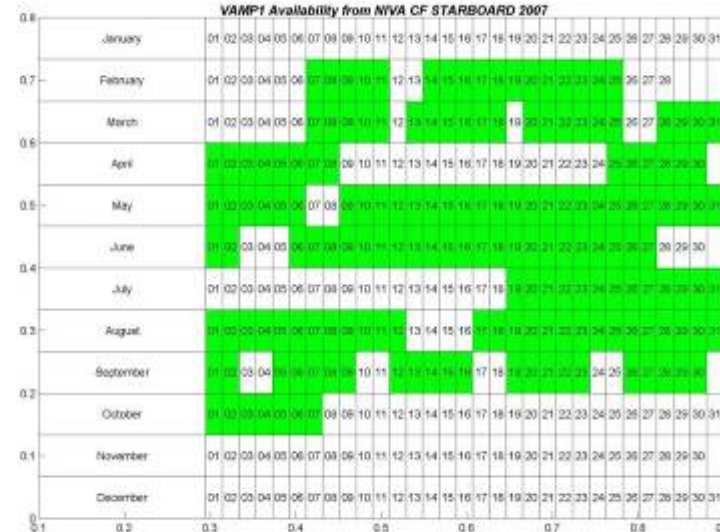

2005

2006

2007

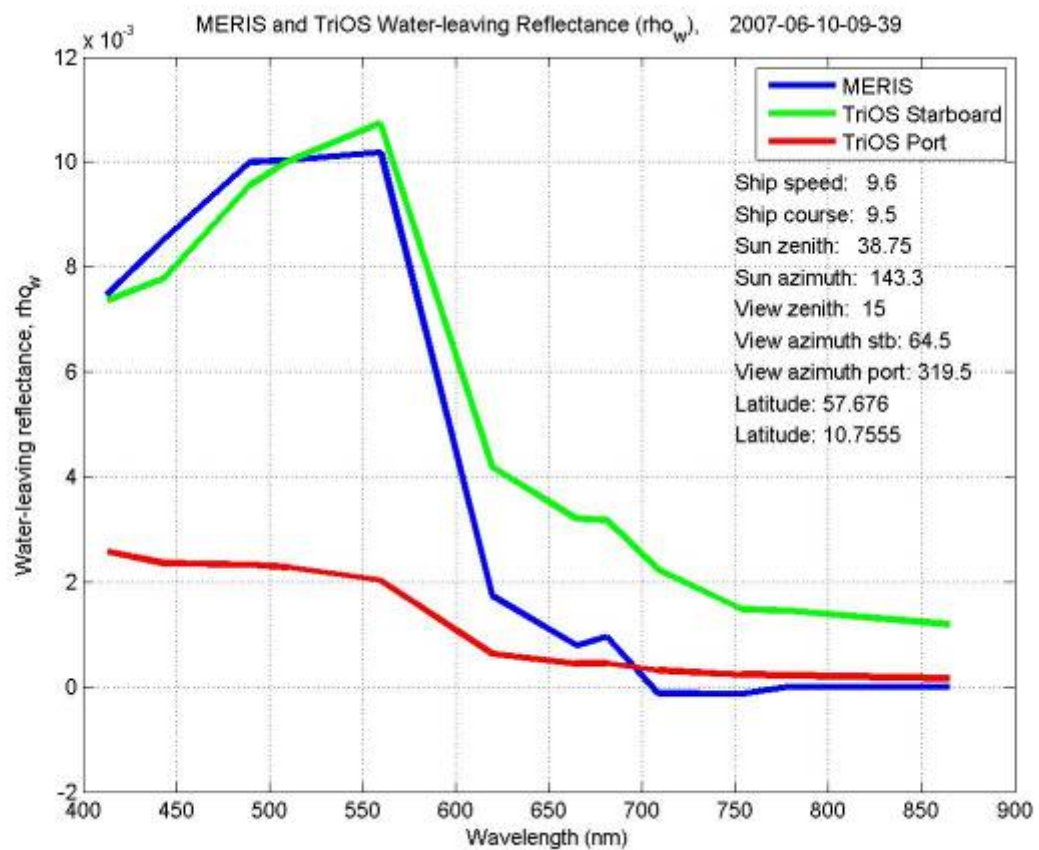

## Identification of matchups

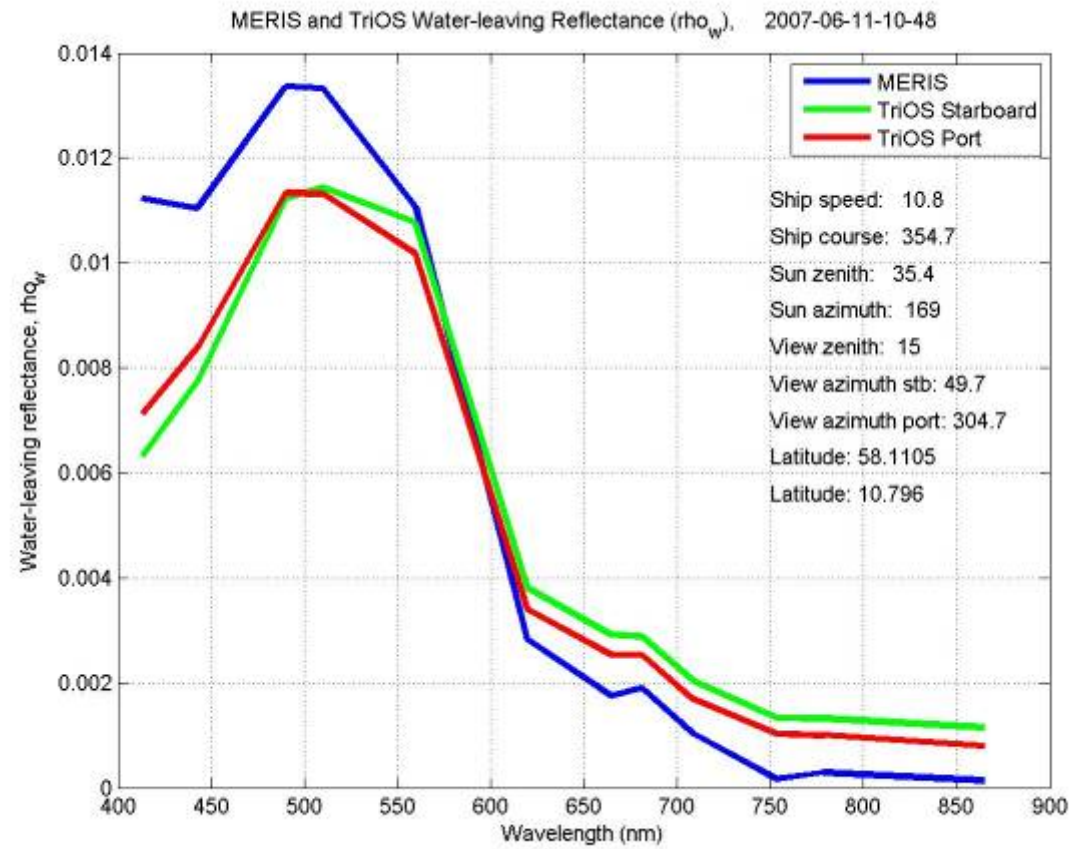

- Color Festival in open waters at MERIS overpass
- Matchup searched for in situ measurements within 3min time window from MERIS overpass time (i.e. ship moved appr. 1.8km)
- MERIS flags (Uncertain normalized surface reflectance) used to identify good MERIS quality

10 June

# 11 June

# Reflectance compared along transect

MERIS  
Trios

Band 5  
560nm

# Future work on radiometric measurements

- Further development and implementation of SOOP data flagging
- Automize data transfer to enable near real-time data processing
- Automize procedures for
  - MERIS data extraction along ship transect
  - MERIS matchup identification
- Validation of SOOP data by research vessel data, investigate discrepancies
- Installation on new lines (e.g. Tromsø-Svalbard)?
- Hydro-optical modelling from simultaneous radiometric and water sensor/sample data
